VOL. XXXII

MONTEREY, HIGHLAND COUNTY VA., FRIDAY, MAY 6, 1910

The instinct of modesty natural to every woman is often a great hindrance to the cure of womanly diseases. Women shrink from the personal questions of the local physician which seem indelicate. The thought of examination is abhorrent to them, and so they endure in silence a condition of disease which surely progresses from bad to worse.

It has been Dr. Pierce's privilege to cure a great many women who have found a refuge for modesty in his offer of FREE consultation by letter. All correspondence is held as sacredly confidential. Address Dr. R. V. Pierce, Buffalo, N. Y.

Dr. Pierce's Favorite Prescription restores and regulates the womanly functions, abolishes pain and builds up and puts the finishing touch of health on every weak woman who gives it a fair trial.

It Makes Weak Women Strong, Sick Women Well.

debted to Professor Mortensen, director of the department of dairying at the State college at Ames, Ia., for the following directions for using it: If you have an old telephone have it repaired, or trade it

and a half inches in diameter and one inch high and fill about three-fourths full of the milk to be tested. The milk should be thoroughly mixed before the sample is taken and be at a temperature of 60 degrees F., though the reading may be taken from 50 to 70 degrees. The lactometer is placed in the milk and the reading taken after it has floated in the milk for a minute. At the same time there should be a reading of the temperature on the thermometer with which the lactometer is equipped. The total solids are ascertained by adding one and two-tenth times the per cent of fat to one-fourth of the lactometer reading. For example, if the lactometer reading 32 and the fat according to the Babcock test is 4 per cent the total solids would be equal to 4×1.2 plus $32 \div 4$, or 4.8 plus 8, or 12.8. If the tempera ture of the milk is above 60 degrees one-tenth should be added to the actometer reading for each degree above, and if the temperature is below 30 degrees one-tenth should be subracied from the lactometer reading for each thermometer degree below. For example, if the lactometer reading at 45 degrees F. is 32 the corrected reading would be 32 plus five-tenths. or 32.5, and if the reading of the lac-

STORED IN ARMORED VAULTS.

The Whole Building Is Embedded In a Solid Concrete Foundation, and the Underground Strong Rooms Are Inpregnable-The Night Watch.

The Philadelphia mint always contains coin and bullion which fluctuates in value each day between a half and shree-quarters of a billion dollars. One hundred millions of dollars of this amount is in silver dollars stored for several years in a room by itself 100 by 55 feet in areat. About \$300,000,000 is in gold coin, ready to be put in circulation or to be stored in the national treasury at Washington against the issue of a corresponding number of gold certificates. A million or two is in bronze and ni kel coins. Finally an amount of builion varying from a small quantity to several hundred millions of dollars' worth occupies the four massive vaults designed for the uncoined metal.

First of all, the whole mint is embedded in a solid concrete foundation about three feet deep. Concrete, as every one knows is one of the strongest of all knewn substances and the most impervious to drilling or wear. Then on the finterior syhere the vaults are placed, within this concrete protection, comes a solid armor of battleship steel six anches thick, so strong that an expert working on it a week could scarcely make an impression, much less penetrate it by hand tools.

this vault are linea with steel plates, and about the entire vaults is the three foot protection of concrete. Within the vault itself are the separate compartments, each locked. These compartments are examined shortly after the end of the fiscal year and are then sealed by the examiners, so that any entrance to hem would be impossible without the breakage of the seals. In each compartment devoted to the storage of gold the coin is stored first in want to retain their jobs will see to bags which contain \$5,000 each in half eagles, eagles or double eagles, and then these bags are arranged twenty on a shelf. Each shelf has thus \$100,-000 on it. The shelves are arranged in rows downward, ten from top to bottom of the compartment, each row having thus \$1,000,000 in gold in it. Electricity lights the entire section

ADULTERATION OF MILK.

A Missouri reader of these notes writes inquiring if there is any simple and correct way of ascertaining whether sweet milk has been adulterated. In several states the pure food laws require that milk shall contain not less than 3 per cent of butter fat nor less than 121/2 per cent of milk solids. The butter fat contact is readily determined by the Babcock test, which is simply made by adding to a graduated test tube of the milk three or four drops of concentrated sulphuric acid, which causes the fatty context to separate as yellow butter oil and rise to the top of the tube, when the proportion it bears to the whole can be easily determined. If the butter fat content is less than 3 per cent there is good reason for believing that the milk has been adulterated or is from a mighty poor cow. The milk solids are readily determined by the Quevenne lactometer, and we are in-
